Abstract. The objective of this paper is to find the closed form of summation theorem for Appell's double hypergeometric function second kind with suitable convergence conditions. In this paper, we find summation theorems of $F_2[A;B,C;A,A;x,y]$, where y takes form $\frac{1-x}{1+x}, \frac{x-1}{2x-1}, \frac{8(1-x)}{8+x}, \frac{1-x}{1+8x}, \frac{x-1}{9x-1}, \frac{1-x}{1+3x}, \frac{x-1}{4x-1}, \frac{3(1-x)}{3+x}, \frac{x-1}{3x-1}, \frac{1-x}{1+2x}$ and other rational functions of x.

1. Introduction, Definitions and Preliminaries

In the usual notation, let $\mathbb{R}$ and $\mathbb{C}$ denote the sets of real and complex numbers, respectively. For definitions of Pochhammer symbol, generalized hypergeometric function ${}_pF_q$, we refer monumental work of Srivastava and Manocha [28], Rainville [22] and other notation have their usual meanings.

The Appell's function: The Appell's function of second kind is defined as

$$F_2[A;B,C;D,G;x,y] = \sum_{r,s=0}^{\infty} \frac{(A)_{r+s}(B)_r(C)_s}{(D)_r(G)_s}\frac{x^r y^s}{r!s!}$$

$$= \sum_{s=0}^{\infty} \frac{(A)_s(C)_s}{(G)_s}\frac{y^s}{s!}\,{}_2F_1\left[\begin{array}{r} A+s,B; \\ D; \end{array} x\right] \tag{1.1}$$

$$\left(|x|+|y|<1,\ D,\ G\in\mathbb{C}\backslash\mathbb{Z}_0^-\right)$$

Classical Gauss summation theorem [28, p.30, Equation 1.2(6)]

$${}_2F_1\left[\begin{array}{r} a,b; \\ d; \end{array} 1\right] = \frac{\Gamma(d)\Gamma(d-a-b)}{\Gamma(d-a)\Gamma(d-b)}\ ,\ \left(\Re(d-a-b)>0,\ d\in\mathbb{C}\backslash\mathbb{Z}_0^-\right). \tag{1.2}$$

Kummer's first summation theorem [9, p.852, Equation (1.3)]:

DOI: 10.28924/APJM/6-19

$$(1.3)\qquad {}_2F_1\left[\begin{array}{c} a,b; \\ a-b+1; \end{array} -1\right] = \frac{2^{-a}\sqrt{\pi}\,\Gamma(a-b+1)}{\Gamma(\frac{1+a}{2})\Gamma(\frac{a}{2}-b+1)} = \frac{\Gamma(1+a-b)\Gamma(1+\frac{a}{2})}{\Gamma(1+\frac{a}{2}-b)\Gamma(1+a)}.$$

$$\Big(a-b\in\mathbb{C}\backslash\mathbb{Z}^-;\ \Re(b)<1\Big).$$

In the year 2007, some generalization of the Kummer's first summation theorem were given by Choi-Rathie and Malani [8, pp. 1523–1524, Equations (2.2), (2.3)], recently some more generalization of the Kummer's first summation theorem were derived by the Qureshi-Baboo [19, p.14, Equations (3.1), (3.2), (3.3) and (3.4)].

Kummer's second summation theorem [9, p.852, Equation (1.4)]

$$(1.4)\qquad {}_2F_1\left[\begin{array}{cc} a, & b; \\ \frac{1+a+b}{2}; & \end{array} \frac{1}{2}\right] = \frac{\Gamma(\frac{1}{2})\Gamma(\frac{1+a+b}{2})}{\Gamma(\frac{a+1}{2})\Gamma(\frac{b+1}{2})}\,; \qquad \left(\frac{1+a+b}{2}\in\mathbb{C}\backslash\mathbb{Z}_0^-\right).$$

A generalization of the Kummer's second summation theorem is recorded by Prudnikov *et al.* [18, p.(491), Entry (7.3.7.2)]. In the year 2011, a generalization of the Kummer's second summation theorem was given by Rakha-Rathie [23, p.827, Theorems (1)], recently some more generalization of the Kummer's second summation theorem were derived by the Qureshi-Baboo [20, p.48, Equations (3.1) and (3.3)].

Kummer's third summation theorem [9, p.852, Equation (1.5)]

$$(1.5)\qquad {}_2F_1\left[\begin{array}{c} a,1-a; \\ c; \end{array} \frac{1}{2}\right] = \frac{2^{1-c}\sqrt{\pi}\,\Gamma(c)}{\Gamma(\frac{c+a}{2})\Gamma(\frac{c+1-a}{2})} = \frac{\Gamma(\frac{c}{2})\Gamma(\frac{c+1}{2})}{\Gamma(\frac{c+a}{2})\Gamma(\frac{c+1-a}{2})}\,; \qquad \left(c\in\mathbb{C}\backslash\mathbb{Z}_0^-\right).$$

In the year 2011, some generalization of the Kummer's third summation theorem were given by Rakha-Rathie [23, p.828, Theorems (6, 5)], recently some more generalization of the Kummer's third summation theorem were derived by the Qureshi-Baboo [21, Equations (3.3) and (3.5)].

Along with these summation theorems, there are so many summation theorems for Gauss hypergeometric function ${}_2F_1$ with different argument. Some summation theorems are recoded in the monographs of Abramowitz [1], Andrews *et al.* [2], Brychkov [5], Erdélyi *et al.* [10], results conjectured by Gosper and given by Geesel and Stanton [11], results derived by Heymann [12] and [13], Per W. karlsson [14], Kummer [15], Lavoie and Trottier [16], Luke [17], Prudnikov *et al.* [18] and Spiegel [26].

2. Summation Theorems Derived by the Reduction Formula 2.1

Any values of parameters and variables leading to the result which do not make sense, are tacitly excluded, then we can write the Appell's function of second kind in the following form

$$(2.1)\qquad F_2[A;B,C;A,A;x,y] = (1-x)^{-B}(1-y)^{-C}\,{}_2F_1\left[\begin{array}{c} B,C; \\ A; \end{array} \frac{xy}{(1-x)(1-y)}\right]$$

$$\left(|x|<1, |y|<1, |\frac{xy}{(1-x)(1-y)}|<1;\ A\in\mathbb{C}\backslash\mathbb{Z}_0^-\right)$$

In the equation (2.1) put $A = a, B = b, C = c, x = \frac{1}{2}$ and $y = \frac{1}{2}$, use the classical Gauss summation theorem, we get

$$F_2\left[a; b, c; a, a; \frac{1}{2}, \frac{1}{2}\right] = 2^{b+c}\frac{\Gamma(a)\Gamma(a-b-c)}{\Gamma(a-b)\Gamma(a-c)} \tag{2.2}$$

$$\left(Re(a-b-c) > 0;\ a \in \mathbb{C}\backslash\mathbb{Z}_0^-\right)$$

In the equation (2.1) put $A = \frac{1+b+c}{2}, B = b, C = c$ and $y = \frac{1-x}{1+x}$, use the classical Gauss summation theorem, we get

$$\left(0 < x < 1;\ \tfrac{1+b+c}{2} \in \mathbb{C}\backslash\mathbb{Z}_0^-\right)$$

$$= \frac{2^{b-1}(1+x)^c\Gamma(\frac{b+c+1+m}{2})\Gamma(\frac{c-b+1-m}{2})}{(1-x)^b(2x)^c\Gamma(b)\Gamma(\frac{c-b+1+m}{2})}\sum_{r=0}^{m}\left\{\binom{m}{r}\frac{(-1)^r\Gamma(\frac{b+r}{2})}{\Gamma(\frac{c+1+r-m}{2})}\right\}, \tag{2.5}$$

$$\left(0 < x < 1;\ b, \tfrac{c+b+1+m}{2}, \tfrac{c-b+1-m}{2} \in \mathbb{C}\backslash\mathbb{Z}_0^-;\ m \in \mathbb{N}_0\right).$$
